## Where can I configure to show a pop-up window when I got new mail?

Contributed by Marc  
20.07.2005

There is a function in Mail Inspector that can pop up a windows (and other actions) as soon as new mail arrived on one of your mailboxes. To do this you have to define a "Notification".

They can be found in the menu File > Options > Notifications.

Add a new one.

Edit that notification and give it a name and choose the account if needed.

Then switch to the second tab called "What".

Here you can configure multiple actions done when this notification is fired. One of them is "display a message box". This is the one you are looking for.

Check the box and edit the message box settings using the "Configure" button next to it.

Give it a try.

Additional Information:

With notifications you can do a lot more things. On the "When" tab you can define complex filters to tell Mail Inspector when this

notification have to be fired. For example you can enter "mary@hotmail.com" as the Sender and play another sound only when you get mail from Mary.

As you might see you can do other things than displaying a message box. To configure this go to the "What" tab and choose one or more of the other actions. These are:

- Show a message box just as you did before.
  
- Play a sound from a .WAV audiofile. There are some default sounds shipped with Mail Inspector but you can choose also your own soundfiles.
  
- Show an animation in the system tray (that's next to the clock in the taskbar). You can choose one of the default animations of Mail Inspector as well as defining your own tray-animation by creating a bitmap file containing all the animation steps in it.
  
- Show a comic animation. This needs the Microsoft Agent subsystem which needs to be installed on your system. On Windows XP it is already pre-installed. You then can use one of the default Microsoft Agents (Peedy, Robo, Merlin or Gene) or download one of hundreds of additional agent characters from the web.
